Conclusions

YES! THE CONVERSATIONS ARE HAPPENING!

What are good methods of observation to avoid self-reporting bias in interviews? My project has to do with sustainable fashion consumption. I have come across this problem that respondents say they care for the environment or say they are shopping/using/discarding clothes in an ecofriendly way but they don't. \nWhat could be an experimental/observational design to measure real behavior? Fake shopping experiment? Observing people when they shop? \n\nI am grateful for any input :)

Predicted:
Sustainability

Actual: Academia

Next Steps:

More data!

Surveys!

Save the planet!

THANK YOU!

"The greatest threat to our planet is the belief that someone else will save it."
